

Amendments to the Claims:

The following listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) Game information for causing an apparatus similar to a computer to function, the apparatus connected to an input system, the input system comprising:

a tablet using an electromagnetic induction method; and

a formed object incorporating a coil for performing predetermined communication using an electromagnetic induction method when placed on the tablet, and a memory for storing identification information on the formed object,

so that, when the formed object is placed on the tablet, the apparatus obtains from the input system a placed position and a direction on the tablet, and identification information on the formed object,

wherein the apparatus is caused to function as:

a change detecting unit for detecting a change of the placed position and the direction obtained from the input system;

a selecting unit for selecting character information corresponding to the identification information obtained from the input system out of a plurality of character information, each of which includes image information on a character imitating a figure of the formed object and is associated with the identification information on the formed object;

a character control unit for disposing the character, imitating the figure of the formed object placed on the tablet, in a game space according to the character information selected by the selecting unit, and for controlling motion and movement of the character according to the change detected by the change detecting unit; and

an image generating unit for generating an image in the game space including the character controlled by the character control unit,

wherein the apparatus further comprises a correlating area setting unit for making a size of a correlating area variable and for setting the correlating area in the game space, the correlating area correlating with a placement detectable area on the tablet, and the character control unit disposes the character in the correlating area and controls the motion and the movement of the character.

2. (Currently Amended) The game information as claimed in claim 1, ~~wherein the apparatus further functions as a correlating area setting unit for setting in the game space an area correlating with a placement detectable area on the tablet, and wherein the character control unit disposes the character, imitating the figure of the formed object placed on the tablet, at a position in the game space~~ the correlating area correlating with the placed position obtained from the input system with the direction obtained from the input system with reference to the area in the game space set by the correlating area setting unit ~~the correlating area.~~

3. (Canceled)

4. (Currently Amended) The game information as claimed in ~~claim 3~~ claim 1, wherein ~~the area variable unit~~ the correlating area setting unit comprises a first size variable unit for ~~making the size of the area in the game space variable, the size setting the size of the correlating area in the game space, the size of the correlating area set according to and corresponding to~~ the character information selected by the selecting unit.

5. (Currently Amended) The game information as claimed in ~~claim 3~~ claim 1, wherein ~~the area variable unit~~ the correlating area setting unit comprises a second size variable unit for ~~making the size of the area in the game space variable, the size setting the size of the~~

correlating area in the game space, the size of the correlating area set according to and corresponding to game progress.

6. (Original) The game information as claimed in claim 1, wherein the formed object comprises a pressure detecting part embedded therein for detecting pressure applied thereto from the outside thereof, the input system comprises a detecting unit for detecting the pressure detected by the pressure detecting part with predetermined communication, the apparatus obtains from the input system the pressure detected by the detecting unit, and the character control unit controls motion and movement of the character based on the pressure obtained from the input system.

7. (Currently Amended) Game information for causing an apparatus similar to a computer to function, the apparatus connected to an input system, the input system comprising:

a tablet using an electromagnetic induction method; and
a printed matter, which has a character picture printed on the printing surface thereof, incorporating a coil for performing predetermined communication using an electromagnetic induction method when placed on the tablet, and a memory for storing identification information on the printed matter,

so that, when the printed matter is placed on the tablet, the apparatus obtains from the input system a placed position and a direction on the tablet, and identification information on the printed matter,

wherein the apparatus is caused to function as:

a change detecting unit for detecting a change of the placed position and the direction obtained from the input system;

a selecting unit for selecting character information corresponding to the identification information obtained from the input system from a plurality of character

information, each of which includes image information on the character printed on the printed matter and is associated with the identification information on the printed matter;

a character control unit for disposing the character, printed on the printed matter placed on the tablet, in a game space according to the character information selected by the selecting unit, and for controlling motion and movement of the character according to the change detected by the change detecting unit; and

an image generating unit for generating an image in the game space including the character controlled by the character control unit,

wherein the apparatus further comprises a correlating area setting unit for making a size of a correlating area variable and for setting the correlating area in the game space, the correlating area correlating with a placement detectable area on the tablet, and the character control unit disposes the character in the correlating area and controls the motion and the movement of the character.

8. (Original) The game information as claimed in claim 1, wherein the change detecting unit comprises a turn detecting unit for detecting a turn direction and/or an amount of turn by detecting a change per predetermined unit time for the direction obtained from the input system, and the character control unit controls motion and movement of the character based on the turn direction and/or the amount of turn detected by the turn detecting unit.

9. (Original) The game information as claimed in claim 7, wherein the change detecting unit comprises a turn detecting unit for detecting a turn direction and/or an amount of turn by detecting a change per predetermined unit time for the direction obtained from the input system, and the character control unit controls motion and movement of the character based on the turn direction and/or the amount of turn detected by the turn detecting unit.

10. (Original) The game information as claimed in claim 1, wherein the change detecting unit comprises a speed detecting unit for detecting a speed by detecting a change per

predetermined unit time for the placed position obtained from the input system, and the character control unit controls motion and movement of the character based on the speed detected by the speed detecting unit.

11. (Original) The game information as claimed in claim 7, wherein the change detecting unit comprises a speed detecting unit for detecting a speed by detecting a change per predetermined unit time for the placed position obtained from the input system, and the character control unit controls motion and movement of the character based on the speed detected by the speed detecting unit.

12. (Original) The game information as claimed in claim 1, wherein the change detecting unit comprises a path detecting unit for detecting a path by detecting a continuous change of the placed position obtained from the input system, and the character control unit controls motion and movement of the character based on the path detected by the path detecting unit.

13. (Original) The game information as claimed in claim 7, wherein the change detecting unit comprises a path detecting unit for detecting a path by detecting a continuous change of the placed position obtained from the input system, and the character control unit controls motion and movement of the character based on the path detected by the path detecting unit.

14. (Original) An information storage medium storing the game information as claimed in claim 1, and being readable by the apparatus similar to a computer.

15. (Original) An information storage medium storing the game information as claimed in claim 7, and being readable by the apparatus similar to a computer.

16. (Currently Amended) A game apparatus connected to an input system, the input system comprising:

a tablet using an electromagnetic induction method; and

a formed object incorporating a coil for performing predetermined communication with the tablet using an electromagnetic induction method when placed on the tablet, and a memory for storing identification information on the formed object,

so that the apparatus obtains from the input system a placed position and a direction on the tablet, and identification information on the formed object when the formed object is placed on the tablet, the apparatus comprising:

a change detecting unit for detecting a change of the placed position and the direction obtained from the input system;

a selecting unit for selecting character information corresponding to the identification information obtained from the input system out of a plurality of character information, each of which includes image information on a character imitating a figure of the formed object and is associated with the identification information on the formed object;

a character control unit for disposing the character, imitating the figure of the formed object placed on the tablet, in a game space according to the character information selected by the selecting unit, and for controlling motion and movement of the character according to the change detected by the change detecting unit; and

an image generating unit for generating an image in the game space including the character controlled by the character control unit,

wherein the apparatus further comprises a correlating area setting unit for making a size of a correlating area variable and for setting the correlating area in the game space, the correlating area correlating with a placement detectable area on the table, and the character control unit disposes the character in the correlating area and controls the motion and the movement of the character.

17. (Currently Amended) A game apparatus connected to an input system, the input system comprising:

a tablet using an electromagnetic induction method; and
a printed matter, which has a character picture on a printing surface thereof,
incorporating a coil for performing predetermined communication using an electromagnetic
induction method when placed on the tablet, and a memory for storing identification
information on the printed matter,

so that the apparatus obtains from the input system a placed position and a
direction on the tablet, and identification information on the printed matter when the printed
matter is placed on the tablet, the apparatus comprising:

a change detecting unit for detecting a change of the placed position and the
direction obtained from the input system;

a selecting unit for selecting character information corresponding to the
identification information obtained from the input system out of a plurality of character
information, each of which includes image information on a character printed on the printed
matter and is associated with the identification information on the printed matter;

a character control unit for disposing the character, printed on the printed
matter placed on the tablet, in a game space according to the character information selected
by the selecting unit, and for controlling motion and movement of the character according to
the change detected by the change detecting unit; and

an image generating unit for generating an image in the game space including
the character controlled by the character control unit,

wherein the apparatus further comprises a correlating area setting unit for
making a size of a correlating area variable and for setting the correlating area in the game
space, the correlating area correlating with a placement detectable area on the tablet, and

the character control unit disposes the character in the correlating area and
controls the motion and the movement of the character.
